

DPOLY Short Course
Polymer Chemistry for Physicists
Saturday March 1, 2003 - 8:00 am - 5:00 pm
Sunday March 2, 2003 - 8:00 am - 5:00 pm

You must pre-register for this course. There is no on-site registration.

Course description:

The preparation of macromolecules with controlled molecular weights, narrow molecular weight distributions, specific comonomer sequences, prescribed end groups, and precise architectures is critically important to polymer physics. Major preparative routes to model polymeric materials will be covered, and the range of materials accessible by a variety of polymerization techniques will be addressed. The goal of this course is to take the mystery out of polymer chemistry.

Who should attend:

The material in the course will be useful to academic and industrial scientists with an interest in polymer science and engineering. Students, postdocs, and faculty interested in contemporary methods of polymer synthesis relevant to macromolecular physics will benefit by attending. The instructors will assume that attendees have a B.S. training in the physical sciences or engineering.

Topics to be covered

Living anionic polymerization controlled free radical polymerization (e.g., Atom Transfer Radical Polymerization, nitroxide mediated, and Radical Addition Fragmentation chain Transfer polymerization), surface initiated polymerization, polymer modification (e.g., hydrogenation, oxidation, and halogenation), metal-catalyzed polymerizations (e.g., Ring-Opening Metathesis Polymerization, and metallocene polymerizations), protein synthesis (via recombinant DNA techniques), specifically functionalized polymers (e.g., endgroup control and isotopic labeling). These methods will be connected to current issues in Polymer Physics.
