DPOLY Short Course

Polymers for Energy Generation and Storage

March 13, 1:00 - 5:30 and March 14, 8:30 – 5:30

Oregon Convention Center

Course Description

Polymers hold much promise as active layers in inexpensive, lightweight energy generating and storing devices. Although the solid state physics and electrochemistry of such devices have been the subject of intense research, it has more recently become clear that an understanding of the polymer physics will lead to both an ability to control nanoscale morphology and optimize transport across the material.

The purpose of this short course is to provide a background in the basic device physics of both organic photovoltaics and batteries to an audience primarily consisting of graduate students, postdoctoral researchers, and early career scientists already knowledgeable in polymer physics. It is hoped that this forum will both provide a basic foundation of knowledge as well as a deeper discussion of outstanding problems and avenues of research in energy relevant polymers.

Each half of the course will begin by covering the basic underlying physics of charge/ion transport as well as device operation. Then our current understanding of the thermodynamics, morphology, self-assembly, and mechanisms of charge transport within these systems will be outlined with significant time reserved for discussion of gaps in current understanding and promising areas of future research.

The course schedule allows for talks from each of the below speakers with ample time for discussion and interaction. This is roughly the schedule that has been followed by recent DPOLY short courses.
